

1. Application Software

Application software is a type of software designed to perform **specific tasks for users**. It runs on top of system software and helps users complete daily activities such as writing documents, browsing the internet, or performing calculations.

Features of Application Software

- User-oriented
- Performs specific tasks
- Easy to use
- Depends on system software

Examples of Application Software

- Word processors (MS Word)
 - Spreadsheets (MS Excel)
 - Web browsers (Chrome, Firefox)
 - Media players (VLC)
 - Accounting software (Tally)
-

2. Types of Text Editors

A **text editor** is a software tool used to create, edit, and modify **plain text files**, especially source code and configuration files.

1. Line Editors

Line editors allow editing of a file **one line at a time** using commands.

Features: - Command-based - No full-screen display

Examples: ed, ex

2. Stream Editors

Stream editors modify text by applying commands to a **stream of text**, usually in a non-interactive way.

Features: - Used for search and replace - Suitable for batch processing

Example: sed

3. Screen-Oriented Editors

These editors provide a **full-screen interface** for interactive editing.

Features: - Cursor-based editing - Real-time text display

Examples: vi, nano, emacs

4. Word Processors

Word processors are advanced text editors used for **document creation**.

Features: - Text formatting - Spell and grammar check

Examples: MS Word, LibreOffice Writer

5. Structure-Oriented Editors

These editors understand the **structure of programs** and assist in coding.

Features: - Syntax highlighting - Error detection

Examples: Visual Studio Code, Eclipse
